

## Connectivity:

### Weight

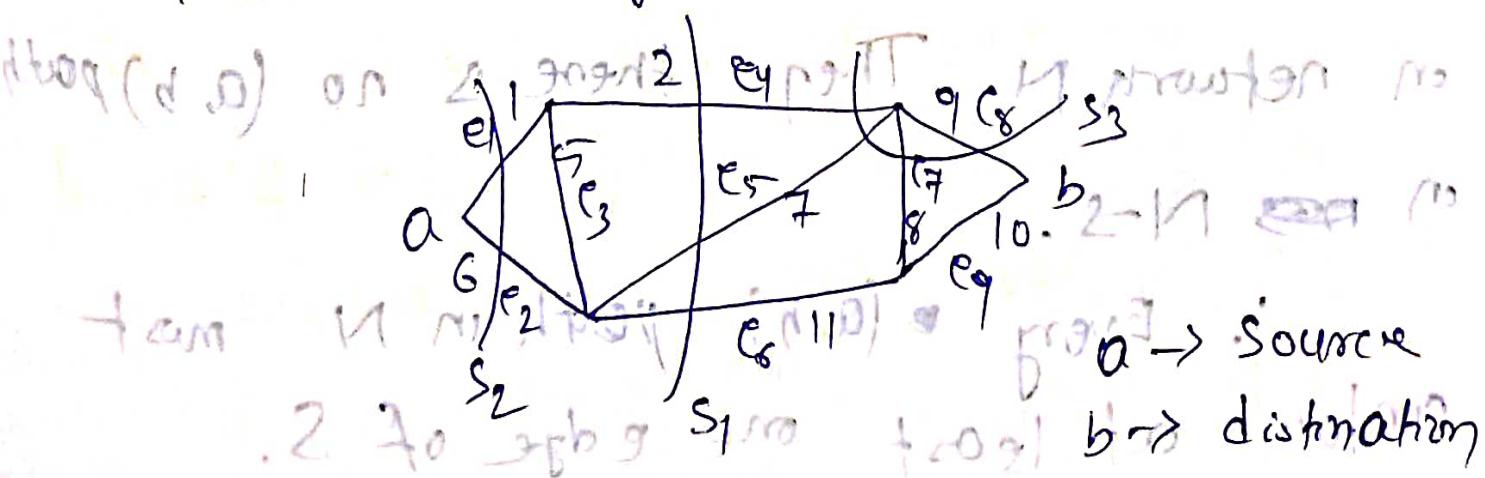

With each edge  $e$  of a graph  $G(n, m)$ , let there be associated a real number  $w(e)$  called its weight, then  $G$  together with these weights is called a weighted graph.

In practice one often uses a weighted graph to find the minimum cost

$$-\text{edges} \text{ with } \sum_{i=1}^m w(e_i) = 40, \text{ in } G \text{ with } 3 \text{ of } 10, 7, 12, 10, 27, 6, 23$$

### Network

A network  $N$  is a weighted connected graph in which the vertices are called stations and the edges are flow lines, through which the given commodity such as oil, gas, water etc., flow.

A cutset (H) = with respect to the vertices  $a \neq b$  in a network  $N$  separates  $a$  &  $b$ .  
 Here  $S_1$  &  $S_2$  are cutsets w.r.t  $a \neq b$ .  
 $S_3$  is not a cutset w.r.t  $a \neq b$ .

Capacity (H)  $\Rightarrow (p)$  AND (i)

The capacity of a cutsets on a

network  $N$  is defined as the sum of the weight of each edges.

$$\text{Capacity}(S_1) = 20$$

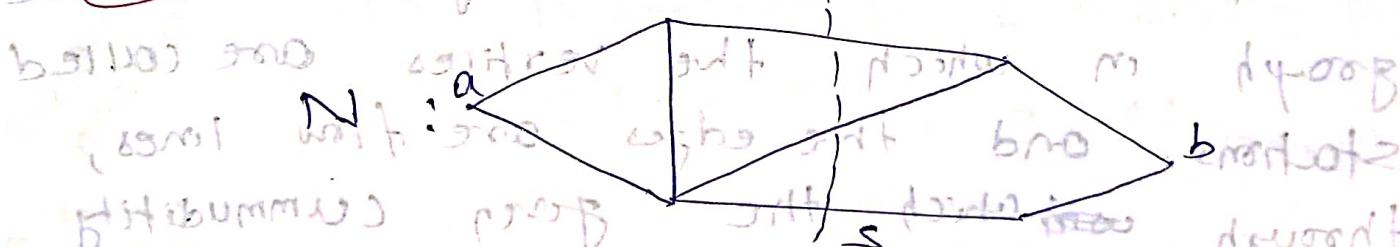

$$\text{Capacity}(S_2) = 7$$

Theorem (maxflow and min cut thm)

The maximum flow possible between two vertices  $a \neq b$  in a network  $N$  is equal to the minimum of the capacities of all cutsets w.r.t  $a \neq b$ .

Proof

Let  $S$  be a cutset w.r.t  $a \neq b$ .

Let  $S$  be a cutset w.r.t  $a \neq b$  in network  $N$ . Then there is no  $(a, b)$  path in  $N - S$ .

Every  $(a, b)$  path in  $N$  must contain at least one edge of  $S$ .

Thus every flow from  $a$  to  $b$  (or from  $b$  to  $a$ ) must pass through one or more edges of  $S$ . Hence the total flow from  $a$  to  $b$  of vertices can't exceed the capacity of  $S$ . Since this holds for all cut sets with respect to  $a \neq b$  it follows that the total flow can't exceed the minimum of ~~the~~ these capacities.

Hence the theorem is proved.
